

CORPORATE CAPABILITIES

Leading Technology . . . Innovative Solutions

Clyde Bergemann EEC, formerly **Environmental Elements Corporation (EEC)**, provides proprietary engineered Air Pollution Control (APC) systems and services which enable customers to operate their facilities in compliance with regulatory standards that limit particulate and gaseous emissions. Our strategy is to provide a broad array of original equipment technologies and reliable aftermarket replacement equipment and service to users of air pollution control systems. The Company primarily serves the electric utility and pulp and paper markets, but also has proven capabilities and significant experience in the municipal solid waste, independent power, steel, rock product and petrochemical industries. The Company has been a leading supplier in the APC business since 1946.

Historically, the Company has designed and manufactured electrostatic precipitators and fabric filter systems. These systems represent the two most effective particulate removal technologies. The Company has developed proprietary designs for durable, cost-effective systems for both of these product lines. In addition, the Company has developed sorbent-based technologies for use in conjunction with its particulate control technologies for both gaseous and heavy metal control.

Clyde Bergemann EEC enters into contracts for new equipment, major rehabilitation and rebuilding of existing equipment, and also provides replacement parts and technical services. The Company performs complete process engineering for APC systems, including the determination of the size, geometry and mechanical, electrical and structural characteristics of the system to meet customer specifications. Clyde Bergemann also provides a full scope of ash removal systems and services.

PRODUCTS & SERVICES

Clyde Bergemann EEC supplies particulate and gaseous air pollution control and auxiliary equipment for power generation and industrial markets. The Company is a full service supplier capable of supplying turnkey systems consisting of new equipment or the rehabilitation and servicing of existing equipment. The Company's products include:

- Electrostatic Precipitators
- Fabric Filters
- Flue-gas Desulphurization and Dry Scrubbing Systems
- Dry Sorbent Storage and Injection Systems
- Mercury Control Systems
- Ash Removal Systems

Serving the Power Generation, Pulp & Paper, Iron & Steel, Rock Products, Wood Products, Petrochemical and Waste-to-Energy industries

Broad range of capabilities for new, rebuild, replacement, parts and service of fabric filters, electrostatic precipitators, and scrubbing systems
